**Amendments to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

1. (currently amended) A tip structure for a support leg for a musical instrument stand, comprising:  
  
    a foot member at a terminal end of said support leg, said foot member having a main  
  
body;  
  
    an elongated spike member disposed in a first aperture of said main body;  
  
    wherein said spike member is resiliently biased to translate in said aperture of said main  
  
body.
2. (original) The tip structure according to claim 1, further comprising an internal locking assembly for locking said spike member in a projecting position with respect to said main body.
3. (original) The tip structure according to claim 2, further comprising a button member slidably disposed in a second aperture of said main body, said button member selectively disengaging said internal locking assembly.

Appl. No. 10/826,377

4. (original) The tip structure according to claim 2, wherein said internal locking assembly comprises a resiliently biased locking plate having a latching portion that engages a detent formed in said spike member.

5. (original) The tip structure according to claim 2, wherein said internal locking assembly is contained within said main body.

6. (original) The tip structure according to claim 1, further comprising a retraction spring biasing said spike member toward a retracted position.

7. (original) The tip structure according to claim 1, further comprising an end cap fitted around a bottom portion of said main body, said end cap having an opening through which said spike member is adapted to pass.

8. (currently amended) The tip structure according to claim 1, further comprising at least one mounting hole disposed on a side of said main body for mounting said main body to ~~at least one~~ said support leg of a stand.

Appl. No. 10/826,377

9. (currently amended) The tip structure according to claim 8, further comprising at least one pivot limiting member for limiting a range of pivotal motion between said main body and said ~~at least one~~ support leg.

10. (original) The tip structure according to claim 2, wherein said locking plate is L-shaped.

11. (original) The tip structure according to claim 2, wherein said locking plate is formed with a latching aperture through which said spike member is adapted to pass.

12. (original) The tip structure according to claim 11, wherein said latching aperture has two portions defining first and second diameters, said spike member adapted to freely pass through said first diameter and said spike member adapted to be locked by said second diameter.

13. (original) The tip structure according to claim 12, wherein said spike member comprises an annular groove engaging said second diameter in said projecting position.

14. (original) The tip structure according to claim 3, further comprising a retraction spring biasing said spike member toward a retracted position when said button member is depressed.

15. (currently amended) A tip structure for a support leg for a stand, comprising:  
a foot member at a terminal end of said support leg having a main body;  
an elongated spike member disposed in a first aperture of said main body;  
an internal locking assembly for locking said spike member in a projecting position with respect to said main body;  
a lock disabling assembly for selectively disengaging said internal locking assembly;  
wherein said spike member is resiliently biased to translate in said aperture of said main body.

16. (original) The tip structure according to claim 15, wherein said lock disabling assembly comprises a button member slidingly disposed in a second aperture of said main body, said button member selectively disengaging said internal locking assembly.

17. (original) The tip structure according to claim 15, wherein said internal locking assembly comprises a resiliently biased locking plate having a latching portion that engages a detent formed in said spike member.

18. (New) Tip structure assemblies for a plurality of support legs for supporting a musical instrument stand, comprising:

a foot member at a terminal end of each of said plurality of said support legs, a plurality of main bodies defined by each said foot member;

elongated spike members disposed in a first aperture of each said main bodies;

wherein said spike members are resiliently biased to translate in said aperture of said main bodies.

19. (New) The tip structure assemblies according to claim 18, further comprising internal locking assemblies for locking said spike members in a projecting position with respect to said main bodies.

20. (New) The tip structure assemblies according to claim 19, further comprising button members slidably disposed in a second aperture of said main bodies, said button members selectively disengaging said internal locking assemblies.
